

### The project

In order to allow trains to travel safely through the tunnels of the Betuwe line, all of the tunnels have been equipped with control and indication panels. The panels provide control of the infrastructural technologies built into the tunnels and are linked to a central post system. The status of the tunnels of the Betuwe line is displayed at this central post.

### The assignment

Moekotte was commissioned by GTI to assemble approximately 450 panels, including fire detection, patch, server, remote I/O and PLC panels. The customer produced designs and drawings of these panels and they were assembled and tested in the workshop in Moekotte Enschede.

### The result

By having the right expertise in the field of series construction, Moekotte proved able to manufacture the large number of panels within the required turnaround time.

### Project information

#### Project kind

Infrastructure Betuwe line tunnel engineering

#### Client

GTI

#### Location

Wormerveer
